Universal Control

Convenience meets comfort with our Universal Control software. The software allows for the control of a group or individual shading system(s) through a single remote.

Want to operate your drapes and venetian blinds at the same time? The remote control can be programmed to send signals to both shading systems so you don't have to keep fumbling for individual remote controls!

Zone Intelligence Hybrid

Transform your motorised shading system into a smart shading system with Zone Intelligence Hub. The system can integrate with multiple window shading hardware brands to ensure seamless control online no matter where you are!

The smart control system can be set to have multiple zones controlled separately within a home to ensure a comfortable environment for all individuals. Installing a new shading system? The system allows for the additional new hardware without needing a new control system.

Graphic User Interface

The GUI displays a map of the installed system using a floorplan. It allows local control for homeowners to the shading system from anywhere at any time. It is designed to integrate with any smart device that has an internet connection and provides customised access with real-time updates.

Each zone can be mapped and controlled through the system via automation or override controls.
